Check-In Documentation

Modules the file imports

- **Datetime**

Name: **Ilyas Nur**

The problem I set out to solve: I chose to figure out how Python can take in a date, or use the current date and time from a Python module, and use that to make certain decisions about deals on vehicles.

Few sentences about the main things I figured out: I figured out how to use the datetime module on python. I also learned how to use the strftime method within that module which returns a string representing the date in the format I specify in its argument.

File that contains my solution and any instructions on how to run the solution:

Check_in_1.py (documentation is written as docstrings)

No special instructions, just run "python3 Check_in_1.py" in your terminal

Directions:

- Datetime module is already installed with Python 3.6 and above
- Just run the script and the method will run based on the day you run the code
