Noh Mesfin Check in 1

The problem:
The problem I had to solve was, how were we going to provide the user with a receipt at the end of their purchase.

How I solved it:
To solve the issue I used the "zip" in Python, which allows us to bring two lists together. In my program, I used a list of different payments and their separate costs. I then used "zip", to bring them together and presented them using a for loop.

Solution file and instructions:

receipt_check_in1.py
To run the file insert "python3 receipt_check_in1.py" into the terminal

Directions:
Run the file by typing "python3 receipt_check_in1.py" into the terminal
